

# Clinical trials: science vs marketing

Dr Tom Jefferson

Honorary Research Fellow

Centre for Evidence Based Medicine

Oxford OX2 6GG

# Disclosure

- Recipient of a UK NIHR grant for a Cochrane review of neuraminidase inhibitors for influenza (2012-14).
- Royalties from books.
- Occasionally interviewed by market research companies on phase I or II pharmaceutical products.
- 2011-13 expert witness in a litigation case on the antiviral oseltamivir, in two litigation cases on potential vaccine-related damage and in a labour case on influenza vaccines in healthcare workers in Canada. Retained as a scientific adviser to a legal team acting on oseltamivir (2014).
- Consultant for Roche (1997-99), GSK (2001-2), Sanofi-Synthelabo (2003), and IMS Health (2013).
- Member of 3 advisory boards for Boehringer Ingelheim (2014-16).
- Holder of a Cochrane Methods Innovations Fund grant to develop guidance on the use of regulatory data in Cochrane reviews.
- Member of an independent data monitoring committee for a Sanofi Pasteur clinical trial on an influenza vaccine (2015-16).
- Potential financial conflict of interest on the drug oseltamivir.

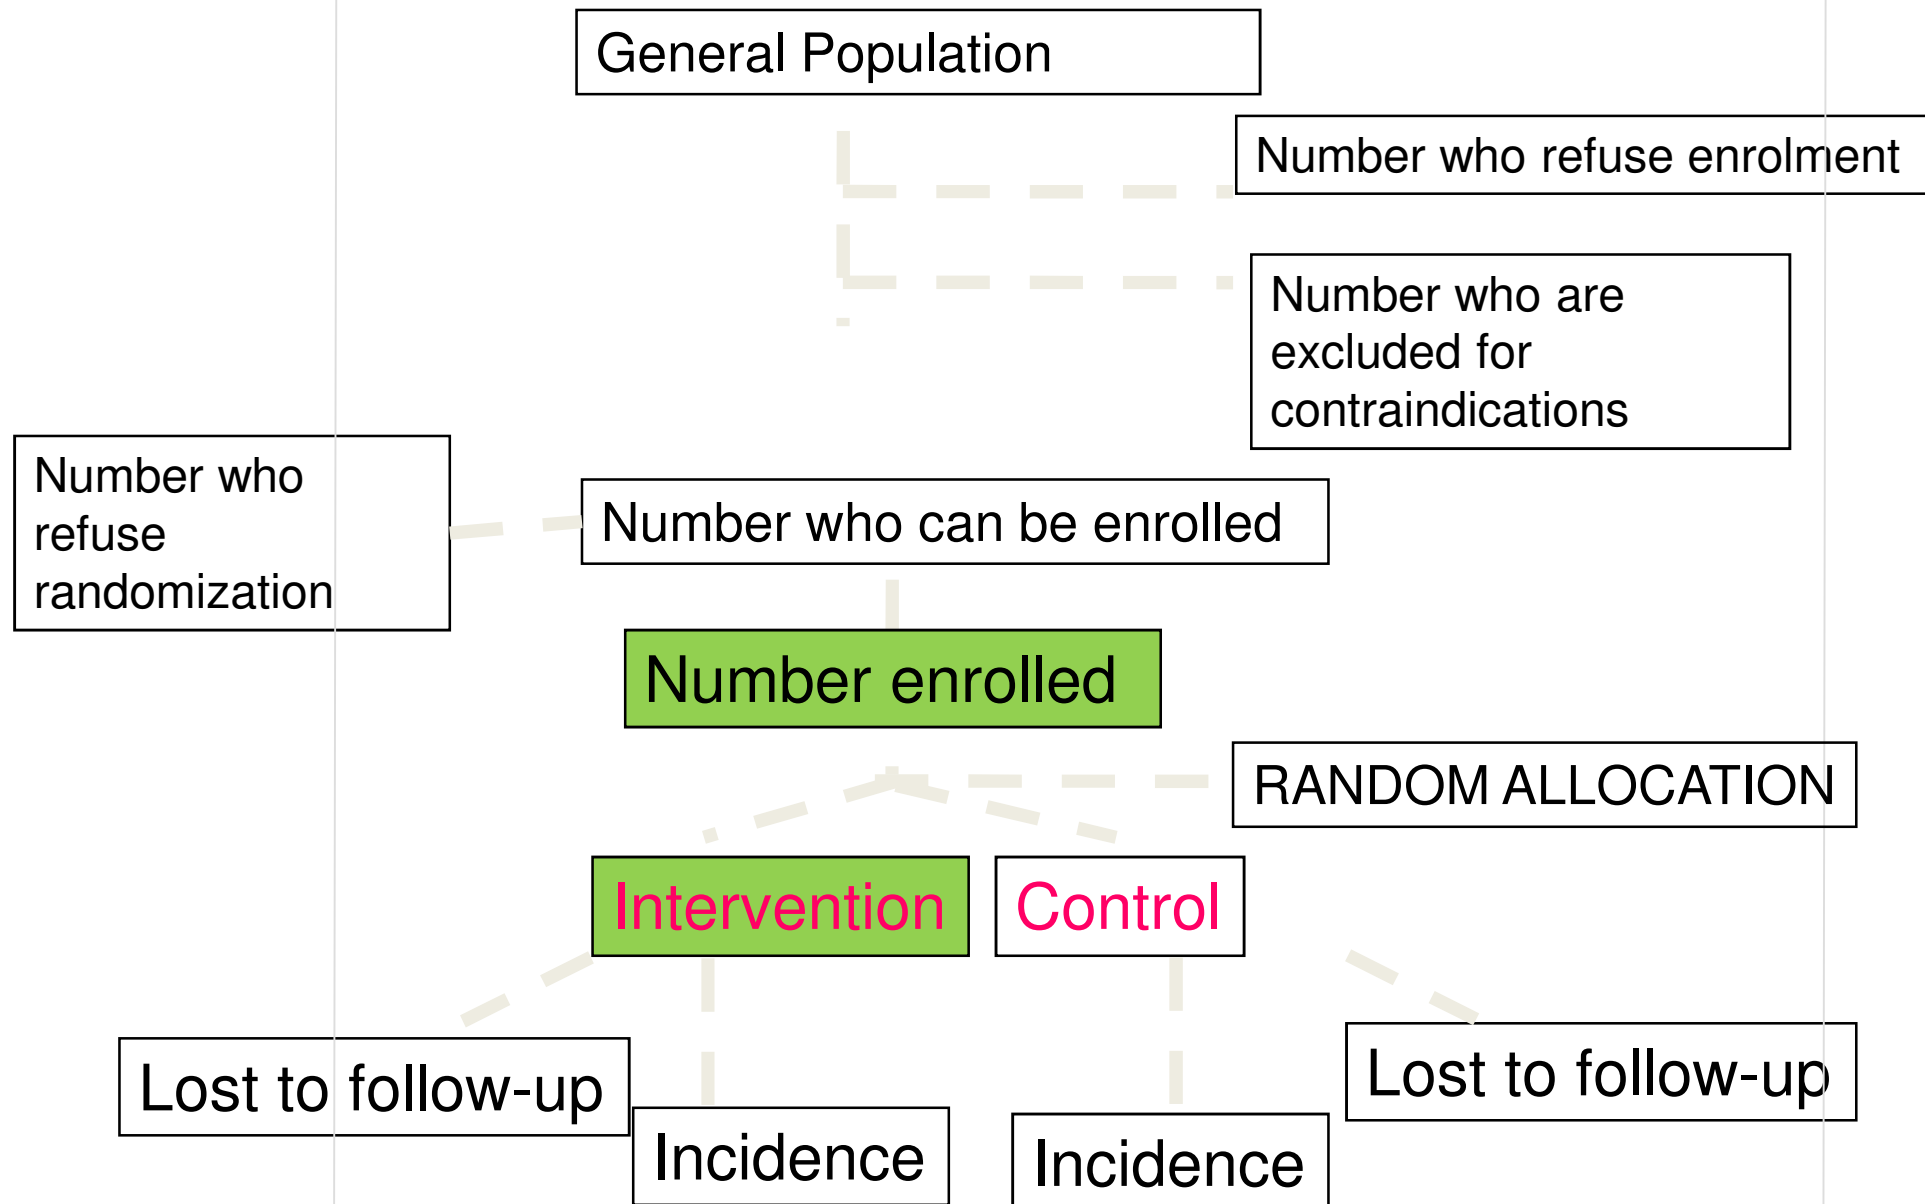

# Index

- Why trials are vital
- Key elements of study design
- Some causes of distortion

# Why trials are vital

- Best chance of comparing like with like
- Closest we can get to pure experiment
- In a well designed and honestly reported trial any observed differences between arms are most likely to be due to the differences between intervention and control

# A hypothetical randomised controlled trial - structure

# Key elements of trial design and reporting

- Objective
- Recruitment
- Random allocation
- Choice of comparator(s)
- Blinding
- Follow up

# Key elements of trial design and reporting

- Outcome definition
- Measurement
- Analysis
- Summary
- Documentation and Reporting

# Causes of distortion

- Poorly worded objective («to confirm..») or shaky rationale
- Recruitment of selected population
- Failed random allocation
- Entry criteria in the analysis population linked with effects of intervention – selection
- If you are worried about harms choose an active comparator
- If you are worried about effectiveness choose a weak comparator

# Causes of distortion

- Make interventions identifiably different (blinding failure)
- Change outcome definitions or ways to measure
- Loss of participants at follow up (attrition)
- Restriction of analysis
- Use of Individual Participant Data (IPD) divorced from methods

# Causes of distortion

- NEVER lie, but be economical with the truth when needed.
- Control data flow
- Hide a tree? Try a forest

# Examples of distortion - Placebo

et al 2010

## 2. Methods

### 2.1. Study design

This was an international, randomised, multicentre, double-blind, parallel-group comparison with placebo or oral dosages of oseltamivir phosphate of 75, 225 or 450 mg b.i.d. (every 12 h) for 5 days. These dosages were chosen to maximise the likelihood of detection of electrocardiographic changes as well as other adverse effects and were based on the previously observed tolerance of dosages as high as 500 mg b.i.d. in studies in healthy adults [2]. The highest dosage for which blinding could be maintained with available formulations was 450 mg. The study took place between 22 August and 25 September 2000.

## CONSENT TO PARTICIPATE IN A STUDY

**TITLE OF STUDY:** A Double-Blind, Randomized, Placebo-Controlled Study of GS4104 (Ro 64-0796) for Prophylaxis Against Human Influenza Virus (HIC#7554)

### Payment

You will receive \$300 for participating in and completing the study. No payment will be made to you, if you withdraw from the study for personal reasons. An additional payment of \$25 will be made each time you are cultured for an influenza type illness. Full payment will be made if you are removed from the study for medical reasons after receiving the study treatment. Other costs such as travel expenses or parking fees resulting from your participation will be your responsibility and are not reimbursable.

In the event that you suffer physical injury directly resulting from the research procedure described in the protocol, no financial compensation for such injury will be available. Medical treatment will be available at no cost to you.

# Trust no one?

Restoring invisible and abandoned trials (RIAT) declaration (from Doshi et al 2013)

**Although by definition no journal publication exists for “unpublished trials,” clinical study reports for industry funded trials often do exist for these unpublished trials, but they have been traditionally treated as secret**

Public conference on clinical drug trials – Geneva 30 September 2016
